Subject: RE: East Palestine OH FTP site

Hi [REDACTED]

Initially, the aircrew should fly the initial "Christmas Tree" pattern. From the target, 100M, 300M and 500M perpendicular to the wind direction, they come back into the wind over the center line to the venting railcar.

If you think lines are best. We can provide the lines about 30 minutes prior to a flight to allow for wind direction.

A question, when they say "vent & burn", do they mean slow release or explosive release. A slow release can take days to accomplish? If they explosively blow it, there is much more likelihood of BLEVE. We are likely to see mostly phosgene, but we will be able to see Vinyl Chloride as well.

Regards, [REDACTED]
